Mounting on 2" pipe	Code 0407
Stainless steel tag plate and wire	Code 9941
Housing prepared for lead seal by customer	Code 8991

## Principle

A flexible sensing element actuates a microswitch by means of a piston. The set point is adjusted by means of a compressible spring installed in opposition.

Set point and reset point must be between 10% and 90% of the selected scale.

### Standard factory adjustment

Setpoint at 50% of the scale on falling pressure

### Customer specific factory adjustment (option SETP)

The following specifications have to be given with the order:

- Setpoint value
- Adjustment on falling or raising pressure

## Adjustable ranges

Scale	P. Max permanent	P. Max accidental	Code	Micro-switch dead band <sup>(1)</sup>

0 ... 60			65	3900	9600
0 ... 100			66	4500	13200

<sup>(1)</sup> The value of the dead band is depending on the value of the set point.

This table contains the dead band values for set point adjustment at 10% and 90% of the selected scale. For other set points the dead band value can be calculated by linear interpolation between the values at 10% and 90%.

**Electrical connections**

**Micro switch**

**Terminal block**

For max. ambient temperature according to temperature classes T5 and T6 refer to technical data on page 1. The installation must be made in an intrinsically safe circuit whose certified electrical safety parameters do not exceed any of the values  $U_{max}$ ,  $I_{max}$  and  $P_{max}$  given in the electrical data on page 1.

All necessary measures must be taken by the user, to avoid the calorific transfer from the fluid to the apparatus head increasing the head's temperature to such that it reaches the self-ignition temperature of the gas in which it is used.
